The sheet may range in thickness from a few thousandths of an inch to as much as 20-40 thousand. A major contributor to this article appears to have a close connection with its subject. The eigenvalue is the frequency (for a given propagation constant) and the eigenvector is the set of current amplitudes on the surface of the scatterers. With this equation for the electric field, the electric field boundary condition (requiring that the total tangential electric field be zero on the surface of PEC scatterer) becomes:  $\sum_{mnp} [k^2 - \alpha_m^2 - \beta_n^2 - \gamma_p^2] G_{mnp} J(\alpha_m, \beta_n, \gamma_p) e^{j(\alpha_m x + \beta_n y + \gamma_p z)} = 0$  (1.3.3) Since we are seeking characteristic modes (eigenmodes) of the structure, there is no impressed E-field on the RHS of this electric field integral equation (EFIE). This
